

Kolar Barrel Hangers

We have front hangers from 1-10 (muzzle), (they change spacing .020 per (.5 mm))

We have 5 diff. (unmarked) mid hangers (they increase appx. .020 per) .040-.060-.080-.095-.110 (largest 2 only raise .015) "not bad math"

There is no chart on relationships between p.o.i. & hangers as the projections coming out of the mono-block vary,

i.e. if the bottom or top bore of two different mono-blocks vary .001/inch, at the end of the barrel there different by 1/32" (.032)

So the hangers become more a philosophy, whats the p.o.i. now & where do you want to go.

"results may vary"
